Lab 1: Report by Chad Hirsch

During lab 1 I learned how to put pictures on a webpage, hyperlink, and how to open the new link in its own tab. The lab also showed how to create HTML documents and the basic structure associated with them. At first I had difficulty open in the pictures in a new window, however through some explanation by the professor I was able to get it up and running very quickly.

At first I thought it was can be very complicated to add images, but after seeing how it was done I was very impressed with how much of the work is actually done by the tags. It was also quite interesting that HTML ignores tags that aren't defined. Which can be a good or bad thing in my opinion.

I also learn that HTML five is case insensitive and does not care whether these are capitalized or not in regards to the tags. However I am aware that using a lower-case letters is the standard regardless.

I found it quite easy to get tripped up on getting the right directory. For example adding or removing a slash at the beginning of the folder location can be the difference between the image appearing on the website and it not appearing.

I think the main questions I have is in regards to the new tags that were introduced to HTML five. Although this is it completely relevant to this particular lab, I definitely am looking forward to learning more about them.
